POSITIONS	Summer 2018 - ongoing: Assistant Professor and Dean's Research Scholar, Boston University Questrom School of Business Fall 2018 - ongoing: Research Affiliate, MIT Initiative on the Digital Economy. April 2022 - ongoing: Contractor at Pro Unlimited at Meta. (Research Collaboration) Summer 2020 - Summer 2023: Hariri Institute for Data Science Junior Fellow Winter 2019 - Winter 2021: Contractor at Pro Unlimited at Meta. (Research Collaboration) 2015 - 2018: Postdoctoral Associate, MIT Sloan School of Management 2012 - 2016: Part-time Data Scientist, Airbnb Inc. 2014 - 2015: Postdoctoral Fellow, National Bureau of Economic Research	
VISITS	Fall 2022 - Kilts Center Visiting Fellow at U. Chicago Booth Fall 2022 - Berkeley Haas School of Business	
EDUCATION	Stanford University, Stanford, California Ph.D. in Economics	September, 2008 - June, 2014
	Duke University, Durham, North Carolina B.S. with High Distinction in Economics and Mathematics w/ minor in Political Science	August, 2004 - May, 2008
RESEARCH FIELDS	Quantitative Marketing, Industrial Organization, Economics of Digitization, Labor Economics	
PUBLICATIONS ¹	Do Incentives to Review Help the Market? Evidence from a Field Experiment on Airbnb (Andrey Fradkin* and David Holtz) <i>Forthcoming at Marketing Science</i> Online reviews are typically written by volunteers and, as a consequence, information about seller quality may be under-provided in digital marketplaces. We study the extent of this under-provision in a large-scale randomized experiment conducted by Airbnb. In this experiment, buyers are offered a coupon to review listings that have no prior reviews. The treatment induces additional reviews and these reviews tend to be more negative than reviews in the control group, consistent with selection bias in reviewing. Reviews induced by the treatment result in a temporary increase in transactions but these transactions are for fewer nights, on average. The effects on transactions and nights per transaction cancel out so that there is no detectable effect on total nights sold and revenue. Measures of transaction quality in the treatment group fall, suggesting that incentivized reviews do not improve matching. We show how market conditions and the design of the reputation system can explain our findings. Dog Eat Dog: Balancing Network Effects and Differentiation in a Digital Platform Merger (with Chiara Farronato and Jessica Fong) <i>Forthcoming at Management Science</i> Mergers among digital platforms are increasingly receiving public and regulatory attention. These mergers may benefit users if network effects from a combined platform are large enough or may hurt users if the two platforms are differentiated and one of the platforms is shut down. We study the net effect of this trade-off in the context of the merger between the two largest platforms for pet-sitting services. We exploit geographic variation in pre-merger market shares and a difference-in-differences approach to causally estimate network effects. We find that users of the acquiring	

platform benefited from the merger because of network effects. However, users of the acquired platform were more likely to exit the market, for reasons including switching costs, coordination failures, and disintermediation. Network effects and attrition offset each other such that at the market level consumers are, on average, not substantially better off with a single combined platform than with two separate and competing platforms. Our results highlight the importance of platform differentiation even when platforms enjoy network effects, which has important implications for antitrust authorities and platform owners.

Self-Preferencing at Amazon: Evidence from Search Rankings

(Chiara Farronato, Andrey Fradkin, Alexander MacKay)

AEA Papers & Proceedings (May 2023)

We study whether Amazon branded products are indeed ranked higher than observably similar products in consumer searches. To show this self-preferencing, we collect new micro-level consumer search data using a custom browser extension installed by a panel of participants we recruited. Using this methodology, we observe search positions, search behavior, and product characteristics. This allows us to evaluate whether Amazon's product are ranked higher in search holding other factors constant.

The Welfare Effects of Peer Entry in the Accommodations Market: The Case of Airbnb

(with Chiara Farronato)

American Economic Review, Volume 112, Issue 6, 2022: 1782-1817

We study the effects of enabling peer supply through Airbnb in the accommodation industry. We present a model of competition between flexible and dedicated sellers - peer hosts and hotels - who provide differentiated products. We estimate this model using data from major US cities and quantify the welfare effects of Airbnb on travelers, hosts, and hotels. The welfare gains are concentrated in locations (New York) and times (New Year's) when hotels are capacity constrained. This occurs because peer hosts are responsive to market conditions, expand supply as hotels fill up, and keep hotel prices down as a result.

Reciprocity and Unveiling in Two-sided Reputation Systems: Evidence from an Experiment on Airbnb (Andrey Fradkin*, Elena Grewal, and David Holtz)

Marketing Science, Volume 40, Issue 6, 2021: 1009-1216

Reputation systems are used by nearly every digital marketplace, but designs vary and the effects of these designs are not well understood. We use a large-scale experiment on Airbnb to study the causal effects of one particular design choice - the timing with which feedback by one user about another is revealed on the platform. Feedback was hidden until both parties submitted a review in the treatment group and was revealed immediately after submission in the control group. The treatment stimulated more reviewing in total. This is due to users' curiosity about what their counterparty wrote and/or the desire to have feedback visible to other users. We also show that the treatment reduced retaliation and reciprocation in feedback and led to lower ratings as a result. The effects of the policy on feedback did not translate into reduced adverse selection on the platform.

Blame the Parents? How Parental Unemployment Affects Labor Supply and Job Quality for Young Adults (with Frederic Panier and Ilan Tojerow)

Journal of Labor Economics, Volume 37, Issue 1, 2019: 35-100.

We study the role of shocks to parental income in determining the labor market outcomes of children entering the labor market. We find that a child whose parent loses a job prior to the child's labor market entry is, on average, induced to work 9 percent more in the 3 years following labor market entry than a child whose parents lose a job after the child's entry. This effect is concentrated on the extensive margin and decreases in magnitude over time. We find no evidence that these shocks affect the quality of the job that entrants find.

¹Equal authorship is the norm in economics. Deviations where there is a first author are denoted by *.

The Impact of Unemployment Insurance on Job Search: Evidence from Google Search Data (with Scott R. Baker)

The Review of Economics and Statistics (2017) 99 (5): 756 – 768.

Job search is a key choice variable in theories of labor markets but is difficult to measure directly. We develop a job search activity index based on Google search data, the Google Job Search Index (GJSI). We validate the GJSI with both survey- and web-based measures of job search. Unlike those measures, the GJSI is high-frequency, geographically precise, and available in real time. We demonstrate the GJSI's utility by using it to study the effects of unemployment insurance (UI) policy changes between 2008 and 2014. We find no evidence of an economically meaningful effect of these changes on aggregate search.

The Welfare Economics of Default Options in 401(k) Plans (with Douglas Bernheim and Igor Popov)

American Economic Review 105.9 (2015): 2798-2837.

Default contribution rates for 401(k) pension plans powerfully influence workers' choices. Potential causes include opt-out costs, procrastination, inattention, and psychological anchoring. We examine the welfare implications of defaults under each of these theories. We show how the optimal default, the magnitude of the welfare effects, and the degree of normative ambiguity depend on the behavioral model, the scope of the choice domain deemed welfare-relevant, the use of penalties for passive choice, and other 401(k) plan features. Depending on which theory and welfare perspective one adopts, virtually any default contribution rate may be optimal. Still, our analysis provides reasonably robust justifications for setting the default either at the highest contribution rate matched by the employer or – contrary to common wisdom – at zero. We also identify the types of empirical evidence needed to determine which case is applicable.

REFEREED
CONFERENCE
PROCEEDINGS:

News from Generative Artificial Intelligence is Believed Less (with Chiara Longoni*, Luca Cian, and Gordon Pennycook)

Fairness, Accountability, and Transparency (ACM FAccT 2022)

Bias and Reciprocity in Online Reviews: Evidence from Field Experiments on Airbnb (with Elena Grewal, David Holtz, Matthew Pearson).

The Sixteenth ACM Conference on Economics and Computation (EC'15).

WORKING PAPERS

Consumer Protection in an Online World: An Analysis of Occupational Licensing

(Chiara Farronato*, Andrey Fradkin*, Brad Larsen*, and Erik Brynjolfsson)

Revise and Resubmitted at AEJ: Applied Economics

We study the effects of occupational licensing on consumer choices and market outcomes in a large online platform for home improvement services. Exploiting exogenous variation in the time licenses are displayed on the platform, we find that platform verified licensing status is unimportant for consumer decisions relative to review ratings and prices. We confirm this result in an independent consumer survey. Licensing restrictions differ widely by state, and persist despite the growing potential of online reputation to reduce information asymmetries. More stringent regulations are associated with less competition, higher prices, and no improvement in consumer satisfaction for transactions on the platform.

Competition Avoidance vs Herding in Job Search: Evidence from Large-scale Field Experiments on an Online Job Board (Andrey Fradkin*, Monica Bhole and John Horton)

Job seekers typically do not know the degree of competition they face for a particular vacancy. As a result, they may unwittingly send applications to jobs with a lot of competition and may overlook jobs with little competition. We study how providing information about competition for a vacancy redirects applications. To do so, we conduct three field experiments on a large online job platform in which treated job searchers are shown information about the number of prior applicants to a vacancy. This information increases overall applications and redirects applications to jobs with few

prior applications. Applications are sent to vacancies that receive fewer cumulative applications but result in similar outcomes to control applications. We use a complementary treatment to show that job seekers also use the age of the vacancy to direct search towards newer jobs with relatively little competition. Our results are consistent with a model in which searchers have imperfect information about competition for a vacancy and redirect their search towards less competitive vacancies when they receive an improved signal.

ONGOING
RESEARCH

The Welfare Effects of Vertically Integrated Platforms: Evidence from E-Commerce Platforms (with Chiara Farronato and Alexander MacKay)

The Economics of Digital Dark Patterns (with Chiara Farronato and Tesary Lin)
2022 Internet Society Foundation Grant (\$150,000)

Algorithmic Auditing Using Targeted Experimentation (with Madhav Kumar, Alex Deng, Michelle Du, Malay Halder, and Peter Coles)

RESTING PAPERS

Search, Matching, and the Role of Digital Marketplace Design in Enabling Trade: Evidence from Airbnb

(This paper is a major revision of the first part of my thesis: “Search Frictions and the Design of Online Marketplaces.”)

Digital peer-to-peer marketplaces have increased trade in underutilized assets. I use the setting of Airbnb to investigate transaction costs in peer-to-peer markets and the role of search engine design in reducing these costs. I show that search is limited, directed, and often results in the rejection of searchers by hosts due to uncertain seller availability. I document the reasons for these rejections and show that rejections cause searchers to leave the market. I then simulate outcomes with alternative consideration sets and find that, without availability tracking by the search engine, the share of rejected contacts would more than double.

Co-organizer of series “Machine Learning for Model-Rich Problems” at the Hariri Institute.

SCHOLARSHIPS, HONORS AND AWARDS

Grants:

2022 Internet Society Foundation Grant (\$150,000)

2022 Questrom Digital Business Institute (\$20,000)

2020 Boston University Hariri Institute Junior Faculty Fellow (\$10,000)

2013 NET Institute Fellowship

Scholarships / Honors:

BU Questrom Dean’s Research Scholar (2022)

Shultz Fellowship Award, George P. Shultz Scholar, Haley-Shaw Fellowship Scholar

Awards:

Allen Starling Johnson, Jr. Best Undergraduate Thesis in Economics Prize

TEACHING EXPERIENCE

2018 - 2023: Measuring Impact with Causal Methods, Business Experimentation and Causal Methods (MBA, Masters in Business Analytics, Undergraduate)

2018: Mathematical Modeling and Marketing (Ph.D.) (joint with Professors Johnson, Srinivasan, and Sun.)

2015 - 2018: Guest lectures: Ph.D. Market Design (Harvard), MBA Marketing Analytics (MIT Sloan, Boston U. Questrom School of Business), MBA Information Economics (MIT Sloan)

2011 - 2012: TA: Advanced Topics in Econometrics (Prof. DeGiorgi), Introduction to Econometrics (Prof. Harding and Prof. Mahajan), Market Design (Prof. Levin).

2007 - 2008: TA: Intermediate Microeconomics (Prof. Yildirim and Prof. Taylor), Financial Markets and Investment (Prof. Eraker), Junior Honors Thesis Seminar (Prof. Tauchen and Prof. Bollerslev).

DATA SCIENCE / OTHER

A National Survey of the Peer-to-Peer Economy (with Chiara Farronato and Rover.com)

Designed a quarterly national survey to measure the current and expected size of the peer-to-peer economy. The survey also quantifies the importance of barriers to the consumption of peer-to-peer services in the labor, hospitality, transportation, and pets markets.

Ranking Algorithm Design:

Co-designed a proprietary algorithm that uses discrete choice models to rank the listings displayed to Airbnb searchers.

Search Experimentation Framework:

Co-designed a system that tracks the actions of searchers and evaluates search experiments.

Operations Experiments:

Designed experiments to evaluate the effectiveness of customer support and platform pricing.

Consulting:

Advised on the design of Airbnb's reputation system, pricing recommendations, marketing strategy, and academic collaboration policy.

Media:

Co-created the Airbnb Hospitality Index and the Airbnb Global Citizenship Index. This work was covered in Le Monde, El Pais, the Telegraph, and other media outlets.
